Abstract of the Disclosure

This is a computerized system that leverages web technologies to provide the mechanism by which the public-at-large can self-initiate the report of an incident, and whereby the system captures data pertinent to the incident in the form of a logical association of all elements of the incident; including, but not limited to: victim, reporting party, location, narrative, incident details, and suspect information. This invention is a remarkable, innovative, and unprecedented system and method that: 1) enables the public-at-large to electronically create an incident report via the Internet, an intranet, or an extranet; 2) guides the public through the process of creating an incident report; 3) profiles the elements of the incident through iterative sets of logically related questions and answers; and, 4) automatically notifies one or more law enforcement agencies of the submission of an incident report by a member of the public-at-large.
